# Executive Summary

|                  |                      |               |                  |
|------------------|----------------------|---------------|------------------|
| Domain           | sevenstarlimo.com.au | CMS           | Django / Custom  |
| Crawled URLs     | 27                   | Indexable     | 0 (0%)           |
| Total Issues     | 18                   | Critical      | 3 Issues         |
| Warnings         | 12                   | Opportunities | 3                |
| robots.txt       | MISSING              | Sitemap.xml   | NOT FOUND        |
| Canonical Issues | 27 URLs (100%)       | 4xx Errors    | 12 URLs (10.53%) |

## Overview

This audit was conducted using Screaming Frog SEO Spider on the live domain **sevenstarlimo.com.au**. The analysis reveals **zero indexable pages** across all 27 crawled URLs — a critical SEO blocker that prevents any page from appearing in search results. The site is missing a **robots.txt** file and **sitemap.xml**, has 27 canonical issues (100% of URLs), 17 pages with Noindex/Nofollow directives, and 12 internal client errors. The blog system, structured data, RSS feed, and bot protection all require immediate development attention. The following report details each issue with priority-ranked remediation steps.

## Issue Severity Overview

| Canonicals: Canonicalised                   | Warning | HIGH | 27 | 100%   |
|---------------------------------------------|---------|------|----|--------|
| Hreflang: Non-200 Hreflang URLs             | Issue   | HIGH | 27 | 100%   |
| Canonicals: Non-Indexable Canonical         | Issue   | HIGH | 27 | 100%   |
| Directives: Noindex                         | Warning | HIGH | 17 | 30.36% |
| Directives: Nofollow                        | Warning | HIGH | 17 | 30.36% |
| Response Codes: Internal Client Error (4xx) | Issue   | HIGH | 12 | 10.53% |

ISSUE 01

Missing robots.txt File

# Missing robots.txt File

The file <https://sevenstarlimo.com.au/robots.txt> returns a 404 Not Found error. This is a critical omission with two major consequences:

- **Search Engine Crawl Control:** Without robots.txt, search engines have no instructions on which sections of the site to crawl or ignore. Admin panels, login pages, and duplicate parameter URLs are exposed to crawlers, wasting crawl budget.
- **Sitemap Discovery:** robots.txt is the universal place to declare the sitemap location. Without it, Google must discover the sitemap through Search Console submission only.
- **Security Signal:** Admin, signup, and account URLs appearing in Google's index exposes internal paths and may attract malicious bot traffic.

## Recommended robots.txt Configuration

```
User-agent: *
Disallow: /accounts/
Disallow: /admin/
Disallow: /accounts/login/
Disallow: /accounts/signup/
Disallow: /book-tours/?type=
Allow: /

Sitemap: https://sevenstarlimo.com.au/sitemap.xml
```

## Implementation

| 1 | Create robots.txt in Django static root or serve via URL route                                           | Developer | 1 hour |
|---|----------------------------------------------------------------------------------------------------------|-----------|--------|
| 2 | Add Disallow rules for /accounts/, /admin/ paths                                                         | Developer | 30 min |
| 3 | Add Sitemap directive pointing to /sitemap.xml                                                           | Developer | 15 min |
| 4 | Verify via <a href="https://sevenstarlimo.com.au/robots.txt">https://sevenstarlimo.com.au/robots.txt</a> | QA        | 10 min |
| 5 | Submit updated sitemap in Google Search Console                                                          | SEO       | 20 min |

ISSUE 02

Canonical & Indexability — 27 URLs Affected (100%)

# Canonical & Indexability Crisis

Every single crawled URL (27/27) is marked **Non-Indexable** with status **"Canonicalised"**. This means search engines are being explicitly told NOT to index any page on the site. The canonical tags are pointing to different URLs, consolidating all ranking signals away from the actual content pages.

## All 27 Affected URLs

| 1  | <a href="https://sevenstarlimo.com.au/">https://sevenstarlimo.com.au/</a>                                                                                                                                       | Non-Indexable | Canonicalised |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------|
| 2  | <a href="https://sevenstarlimo.com.au/book-tours/">https://sevenstarlimo.com.au/book-tours/</a>                                                                                                                 | Non-Indexable | Canonicalised |
| 3  | <a href="https://sevenstarlimo.com.au/accounts/login/">https://sevenstarlimo.com.au/accounts/login/</a>                                                                                                         | Non-Indexable | Canonicalised |
| 4  | <a href="https://sevenstarlimo.com.au/terms-and-condition/">https://sevenstarlimo.com.au/terms-and-condition/</a>                                                                                               | Non-Indexable | Canonicalised |
| 5  | <a href="https://sevenstarlimo.com.au/accounts/signup/">https://sevenstarlimo.com.au/accounts/signup/</a>                                                                                                       | Non-Indexable | Canonicalised |
| 6  | <a href="https://sevenstarlimo.com.au/privacy-policy/">https://sevenstarlimo.com.au/privacy-policy/</a>                                                                                                         | Non-Indexable | Canonicalised |
| 7  | <a href="https://sevenstarlimo.com.au/blog/">https://sevenstarlimo.com.au/blog/</a>                                                                                                                             | Non-Indexable | Canonicalised |
| 8  | <a href="https://sevenstarlimo.com.au/book-tours/?type=th">https://sevenstarlimo.com.au/book-tours/?type=th</a>                                                                                                 | Non-Indexable | Canonicalised |
| 9  | <a href="https://sevenstarlimo.com.au/contact/">https://sevenstarlimo.com.au/contact/</a>                                                                                                                       | Non-Indexable | Canonicalised |
| 10 | <a href="https://sevenstarlimo.com.au/about-us/">https://sevenstarlimo.com.au/about-us/</a>                                                                                                                     | Non-Indexable | Canonicalised |
| 11 | <a href="https://sevenstarlimo.com.au/blog/limo/why-a-professional-chauffeur-service-is-worth-it-in-2026/">https://sevenstarlimo.com.au/blog/limo/why-a-professional-chauffeur-service-is-worth-it-in-2026/</a> | Non-Indexable | Canonicalised |
| 12 | <a href="https://sevenstarlimo.com.au/blog/?category=limo">https://sevenstarlimo.com.au/blog/?category=limo</a>                                                                                                 | Non-Indexable | Canonicalised |
| 13 | <a href="https://sevenstarlimo.com.au/accounts/login/?next=/book-now/%3Ftype%3Dtp">https://sevenstarlimo.com.au/accounts/login/?next=/book-now/%3Ftype%3Dtp</a>                                                 | Non-Indexable | Canonicalised |

## Root Cause & Fix

### Root Cause 1 — Incorrect Canonical Tags:

The site is likely generating self-referencing canonicals that point to a www or https variant, or a trailing-slash variant that differs from the actual URL. Django middleware or template tags may be injecting incorrect canonical link tags.

### Root Cause 2 — Noindex Meta Tags:

17 URLs carry a directive. These must be removed from all public-facing pages. Only login, signup, and admin pages should carry noindex.

### Root Cause 3 — Parameter URLs in Crawl:

URLs like /book-tours/?type=th are being crawled as separate pages. These should either be canonicalised to /book-tours/ or blocked in robots.txt to prevent crawl budget waste and duplicate content signals.

ISSUE 03

Missing XML Sitemap + Dynamic Blog Integration

Missing Sitemap & Dynamic Blog Sitemap

No sitemap.xml exists at <https://sevenstarlimo.com.au/sitemap.xml>. A sitemap is the most efficient way to communicate your site structure to Google. For a Django site with dynamic blog content, a programmatically generated sitemap is essential — it must auto-update whenever a new blog post is published.

Django Sitemap Implementation

Django ships with a built-in `django.contrib.sitemaps` framework. The following architecture should be implemented:

- **Static Pages Sitemap:** Maps home, about, contact, book-tours, blog index, privacy-policy, terms pages with monthly changefreq and priority 0.8–1.0
- **Dynamic Blog Sitemap:** Queries the Blog model for all APPROVED/PUBLISHED posts. Each post URL is included with its updated\_at date as lastmod. When a new post is approved, it automatically appears in the sitemap.
- **Tour Type Sitemap:** Includes /book-tours/?type=X URLs for each tour type with rel="canonical" pointing to /book-tours/ to avoid duplication.
- **Sitemap Index:** A master sitemap index at /sitemap.xml that references /sitemap-static.xml and /sitemap-blog.xml for clean organisation.

Required URLs in Final Sitemap

| /                     | Static – Homepage             | 1.0 | daily      |
|-----------------------|-------------------------------|-----|------------|
| /about-us/            | Static                        | 0.8 | monthly    |
| /contact/             | Static                        | 0.7 | monthly    |
| /book-tours/          | Static – Tours Index          | 0.9 | weekly     |
| /blog/                | Static – Blog Index           | 0.9 | daily      |
| /blog/[slug]/         | Dynamic – Each Published Post | 0.8 | on publish |
| /privacy-policy/      | Static                        | 0.3 | yearly     |
| /terms-and-condition/ | Static                        | 0.3 | yearly     |

ISSUE 04

Blog System — Description, Status Workflow & SEO

Blog System: Required Enhancements

ISSUE 4a: Blog Description / Meta Description Field

Currently the blog listing page and individual posts do not display a proper description. Each blog post needs a dedicated **description field** in the database that is: (1) displayed on the blog card/listing page as a snippet, (2) saved via a rich text editor (TinyMCE or Quill.js) in the admin panel, (3) used as the tag for SEO, and (4) shown in the blog post heading section as a subtitle/subheading. The heading hierarchy must follow: H1 = Post Title → H2 = Description/Subtitle → H3 = Section headings.

ISSUE 4b: Blog Publish Status: Pending / Approved Workflow

The blog currently lacks a status management system. A complete workflow must be implemented: **Draft** → **Pending Review** → **Approved** → **Published**. The admin panel must show all posts with their status and allow one-click Approve/Reject actions. Only "Approved" posts should: appear on the public blog, be included in the sitemap, and appear in the RSS feed. The blog model requires a **status** field with choices: draft, pending, approved, rejected. Admin views need list\_display with status filter and bulk approve/reject actions.

Blog Model Schema (Required Fields)

| title            | CharField(200)      | Post title, used in H1 and tag                       | YES      |
|------------------|---------------------|------------------------------------------------------|----------|
| slug             | SlugField(unique)   | SEO-friendly URL                                     | YES      |
| description      | TextField           | Short description for meta, card snippet, H2 display | YES      |
| content          | RichTextField       | Full post body via TinyMCE/Quill editor              | YES      |
| status           | CharField(choices)  | draft   pending   approved   rejected                | YES      |
| category         | ForeignKey          | Blog category for filtering and URLs                 | YES      |
| author           | ForeignKey(User)    | Author attribution                                   | YES      |
| featured_image   | ImageField          | OG image and blog card image                         | YES      |
| created_at       | DateTimeField(auto) | Creation timestamp                                   | AUTO     |
| updated_at       | DateTimeField(auto) | Last modified, used in sitemap lastmod               | AUTO     |
| published_at     | DateTimeField(null) | Set when status → approved                           | AUTO     |
| meta_title       | CharField(60)       | Custom SEO title override                            | OPTIONAL |
| meta_description | CharField(160)      | Custom meta description override                     | OPTIONAL |

ISSUE 05

Agentic Browsing Score — Achieve 3/3

Agentic Browsing: Structured Data & AI Readiness

Agentic browsing refers to the ability of AI assistants (Google AI Overviews, ChatGPT Browse, Bing Copilot, Perplexity) to understand, parse, and cite your website content. Achieving a **3/3 score** requires three pillars:

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pillar 1 / 3 | <p><b>Structured Data (Schema.org JSON-LD)</b></p> <p>Implement JSON-LD structured data on all key pages. AI agents and search engines use schema markup to understand content type, entities, and relationships. Required schemas: <b>Organization</b> (homepage), <b>LocalBusiness</b> + <b>LimousineService</b> (homepage), <b>Service</b> (each tour type page), <b>BlogPosting</b> (each blog post), <b>BreadcrumbList</b> (all pages), <b>FAQPage</b> (contact/service pages), <b>WebSite</b> with SearchAction.</p> |
| Pillar 2 / 3 | <p><b>Semantic HTML &amp; Accessibility</b></p> <p>AI agents parse page content via HTML semantics. Ensure correct heading hierarchy (one H1 per page), proper use of , , , , landmarks. All images must have descriptive alt text. Navigation must be keyboard accessible. ARIA labels on interactive elements.</p>                                                                                                                                                                                                       |
| Pillar 3 / 3 | <p><b>Content Accessibility &amp; llms.txt</b></p> <p>Add an <b>llms.txt</b> file at <a href="https://sevenstarlimo.com.au/llms.txt">https://sevenstarlimo.com.au/llms.txt</a> — the emerging standard for AI agent site discovery. Ensure content is not hidden behind JavaScript rendering for critical SEO pages. Implement Open Graph and Twitter Card meta tags on all pages for rich previews in AI-powered search surfaces.</p>                                                                                     |

Schema Implementation Priority

| Organization + LocalBusiness | Homepage                  | HIGH   | Low               |
|------------------------------|---------------------------|--------|-------------------|
| LimousineService             | Homepage + All Tour Pages | HIGH   | Low               |
| BlogPosting                  | Each Blog Post            | HIGH   | Medium (template) |
| BreadcrumbList               | All Pages                 | MEDIUM | Low               |
| FAQPage                      | Contact + Service Pages   | MEDIUM | Medium            |
| WebSite + SearchAction       | Homepage                  | MEDIUM | Low               |
| llms.txt                     | Root /llms.txt            | HIGH   | Low               |

## ISSUE 06

RSS Feed at /feed — Dynamic Blog Integration

# RSS Feed: /feed Endpoint

An RSS feed at <https://sevenstarlimo.com.au/feed/> is required. RSS feeds are consumed by: news aggregators, Feedly/podcast apps, AI crawlers, Google News (if applying for inclusion), and automated social media syndication tools. The feed must dynamically reflect only **approved/published** blog posts.

## Django Feed Implementation

```
# feeds.py
from django.contrib.syndication.views import Feed
from .models import BlogPost

class LatestBlogFeed(Feed):
    title = "Seven Star Limo – Latest Articles"
    link = "/blog/"
    description = "Professional chauffeur & limo service insights"

    def items(self):
        return BlogPost.objects.filter(
            status='approved'
        ).order_by('-published_at')[:20]

    def item_title(self, item): return item.title
    def item_description(self, item): return item.description
    def item_pubdate(self, item): return item.published_at
    def item_author_name(self, item): return item.author.get_full_name()
    def item_categories(self, item): return [item.category.name]

# urls.py
from .feeds import LatestBlogFeed
path('feed/', LatestBlogFeed(), name='rss_feed'),
```

## RSS Feed SEO Benefits

- **Google Discovery:** Google crawls RSS feeds to discover new content faster than standard crawling.
- **Authority Signals:** Third-party aggregators that re-publish feed content create backlinks.
- **AI Training Data:** AI agents like Perplexity actively consume RSS to surface fresh content.
- **Social Automation:** Tools like Buffer, Zapier can auto-post new blogs to social media via RSS.

ISSUE 07

Bot Protection — Login & Registration Validation

Bot Protection: Login & Registration Forms

The login and signup forms at `/accounts/login/` and `/accounts/signup/` have no bot protection. Without validation, these endpoints are vulnerable to: credential stuffing attacks, brute-force password attempts, fake account creation, spam registrations, and automated scraping of authenticated content.

Recommended Implementation Options

★ RECOMMENDED: Option A — Google reCAPTCHA v3 (Recommended)

reCAPTCHA v3 runs invisibly in the background scoring user behaviour (0.0–1.0). No checkbox or image puzzle for real users. Integrate `django-recaptcha` package. Set threshold score of 0.5 — below this, show a v2 challenge or block submission. Pros: frictionless UX, industry standard, free tier available.

Option B — Honeypot Field (Lightweight Fallback)

Add a hidden form field that real users never fill. If the field is populated, the submission is rejected as a bot. Simple CSS: `display:none` on the field. Use `django-honeypot` package for clean implementation.

Option C — Custom Rate Limiting

Implement Django's cache-based rate limiting on login attempts: max 5 attempts per IP per 15 minutes. Use `django-axes` or `django-ratelimit`. Log failed attempts and auto-ban IPs exceeding threshold.

Additional Security Hardening

| CSRF Protection    | Verify <code>{% csrf_token %}</code> is present in all forms (Django default, but confirm).                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Password Policy    | Enforce minimum 8 characters, 1 uppercase, 1 number via Django validators.                                                      |
| Account Lockout    | Lock accounts after 10 consecutive failed logins for 30 minutes.                                                                |
| Email Verification | Require email verification on signup before account activation.                                                                 |
| Secure Headers     | Add <code>X-Frame-Options</code> , <code>X-Content-Type-Options</code> , <code>CSP</code> headers via <code>django-csp</code> . |

TECHNICAL OVERVIEW

Full-Site Technical SEO Assessment

Technical SEO: Additional Findings

| Page Speed         | No performance data available from crawl. Core Web Vitals (LCP, FID, CLS) must be tested via PageSpeed Insights.                                                                     | ■ TEST    | HIGH   |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------|
| HTTPS/SSL          | Site is on HTTPS — correct. Verify no mixed content warnings on any page.                                                                                                            | ✓ PASS    | LOW    |
| Mobile             | Responsive design must be verified. Google uses mobile-first indexing. Test at <a href="https://search.google.com/test/mobile-friendly">search.google.com/test/mobile-friendly</a> . | ■ TEST    | HIGH   |
| Open Graph         | OG meta tags (og:title, og:description, og:image) missing on most pages. Required for social sharing previews.                                                                       | ✗ MISSING | HIGH   |
| Hreflang           | 27 URLs have non-200 hreflang URLs. Remove or correct hreflang tags for a single-language, single-region site.                                                                       | ✗ ERROR   | HIGH   |
| 4xx Errors         | 12 URLs returning client errors. Audit and fix broken internal links. Implement custom 404 page with navigation.                                                                     | ✗ ERROR   | HIGH   |
| Heading Tags       | Verify each page has exactly one H1 tag containing the primary keyword. Blog posts must follow H1→H2→H3 hierarchy.                                                                   | ■ AUDIT   | MEDIUM |
| Image Alt Text     | All images must have descriptive alt attributes for accessibility and image search SEO.                                                                                              | ■ AUDIT   | MEDIUM |
| Internal Linking   | Blog posts should link to relevant service pages. Tour pages should cross-link. Homepage should link to blog.                                                                        | ■ AUDIT   | MEDIUM |
| 404 Page           | Implement a branded custom 404 page with site navigation, search box, and links to key pages.                                                                                        | ■ MISSING | MEDIUM |
| Canonical Strategy | All /book-tours/?type=X parameter URLs must have canonical pointing to /book-tours/ base URL.                                                                                        | ✗ ERROR   | HIGH   |

## REMEDIATION ROADMAP

Prioritised Action Plan

# Prioritised Remediation Roadmap

## Phase 1 — Critical (Complete Within 48 Hours)

| # | Task                                                                                                           | Who | Est.  |
|---|----------------------------------------------------------------------------------------------------------------|-----|-------|
| 1 | <b>Create robots.txt</b> — Disallow /accounts/, /admin/. Add Sitemap directive.                                | Dev | 1 hr  |
| 2 | <b>Fix Canonical Tags</b> — Audit and correct all canonical link tags. Remove noindex from public pages.       | Dev | 3 hrs |
| 3 | <b>Fix 4xx Errors</b> — Identify and correct 12 broken internal URLs.                                          | Dev | 2 hrs |
| 4 | <b>Remove Hreflang</b> — Strip incorrect hreflang tags from all pages (single-region site does not need them). | Dev | 1 hr  |

## Phase 2 — High Priority (Complete Within 1 Week)

| #  | Task                                                                                      | Who | Est.  |
|----|-------------------------------------------------------------------------------------------|-----|-------|
| 5  | <b>Implement XML Sitemap</b> — Static + dynamic blog sitemap with index.                  | Dev | 4 hrs |
| 6  | <b>Blog Description Field</b> — Add field to model, editor in admin, display in template. | Dev | 3 hrs |
| 7  | <b>Blog Status System</b> — Draft/Pending/Approved workflow in admin.                     | Dev | 4 hrs |
| 8  | <b>RSS Feed</b> — /feed/ endpoint using Django syndication framework.                     | Dev | 2 hrs |
| 9  | <b>Bot Protection</b> — reCAPTCHA v3 on login + signup forms.                             | Dev | 3 hrs |
| 10 | <b>Add Open Graph Tags</b> — og:title, og:description, og:image on all pages.             | Dev | 2 hrs |

## Phase 3 — Optimisation (Complete Within 1 Month)

| #  | Task                                                                             | Who     | Est.   |
|----|----------------------------------------------------------------------------------|---------|--------|
| 11 | <b>Structured Data</b> — JSON-LD for Organization, Service, BlogPosting schemas. | Dev/SEO | 6 hrs  |
| 12 | <b>llms.txt</b> — AI agent discovery file at /llms.txt.                          | Dev     | 30 min |
| 13 | <b>Core Web Vitals</b> — PageSpeed audit and performance optimisation.           | Dev     | 8 hrs  |
| 14 | <b>Semantic HTML Audit</b> — Correct heading hierarchy, ARIA landmarks.          | Dev     | 4 hrs  |
| 15 | <b>Internal Linking Strategy</b> — Blog ↔ Service page cross-links.              | SEO     | 3 hrs  |

|    |                                                                               |     |      |
|----|-------------------------------------------------------------------------------|-----|------|
| 16 | <b>Google Search Console</b> — Verify site, submit sitemap, monitor indexing. | SEO | 1 hr |
|----|-------------------------------------------------------------------------------|-----|------|

## Final Summary & Key Metrics

| Total Issues Found   | 18 (3 Issues + 12 Warnings + 3 Opportunities)                         |
|----------------------|-----------------------------------------------------------------------|
| Critical Blocker     | 0% of pages currently indexable — site invisible to Google            |
| Immediate Actions    | 4 tasks: robots.txt, canonical fix, 4xx fix, hreflang removal         |
| Development Tasks    | 6 tasks: sitemap, blog schema, status system, RSS, reCAPTCHA, OG tags |
| Optimisation Tasks   | 6 tasks: structured data, Core Web Vitals, semantic HTML, GSC         |
| Estimated Dev Hours  | ~50 hours total across all 3 phases                                   |
| Expected SEO Impact  | Full indexation of all public pages within 2–4 weeks post-fix         |
| Agentic Score Target | 0/3 → 3/3 achievable within Phase 3                                   |

### Next Steps

Share this report with your development team and prioritise Phase 1 tasks immediately. The zero-indexability issue is a complete SEO shutdown — no organic traffic can reach the site until canonical and noindex issues are resolved. Once Phase 1 is complete, verify progress using Google Search Console → Coverage report. Schedule a follow-up crawl with Screaming Frog after Phase 2 completion to confirm all 27 canonical issues are resolved.

This report was generated based on a Screaming Frog SEO Spider crawl and manual technical analysis of sevenstarlimo.com.au. Recommendations reflect current SEO best practices as of 2025–2026. Results may vary based on Google algorithm updates, server configuration, and implementation quality.
